《数据库系统原理》实验报告(5)

题目: MiniOB 实验 2

学号 | 2154312 | 姓名 | 郑博远 | 日期 | 2023.11.22

实验环境:

硬件配置: 联想小新 Pro 14ACH 2021

CPU: AMD Ryzen 7 5800H with Radeon Graphics

操作系统: Windows11 编辑器: VSCode

实验步骤及结果截图:

本次实验中,我选择了 drop_table 语句进行实现。

1. 首先,增加 drop_table 对应的 statement 语句。在"src\observer\sql\stmt\"下增加"drop_table_stmt.h" 与 "drop_table_stmt.cpp" 文件,对应代码如下:

```
// Created by Boyuan Zheng on 2023.11.22
#include "drop table stmt.h"
#include "event/sql debug.h"
RC DropTableStmt::create(Db *db, const DropTableSqlNode &drop table, Stmt
   stmt = new DropTableStmt(drop table.relation name);
   sql debug("drop table statement: table name %s",
drop table.relation name.c str());
   return RC::SUCCESS;
// Created by Boyuan Zheng on 2023.11.22
#pragma once
#include <string>
#include <vector>
#include "sql/stmt/stmt.h"
class Db;
class DropTableStmt : public Stmt
public:
 DropTableStmt(const std::string &table_name) : table_name_(table_name) {}
 virtual ~DropTableStmt() = default;
 StmtType type() const override { return StmtType::DROP TABLE; }
 const std::string &table name() const { return table name ; }
 static RC create(Db *db, const DropTableSqlNode &drop table, Stmt *&stmt);
private:
   std::string table_name_;
```

```
};
```

2. 在同目录下的 stmt.cpp 的 create_stmt 函数中,添加对应的 case:

```
...
case SCF_CREATE_TABLE: {
    return CreateTableStmt::create(db, sql node.create table, stmt);
}

// Added by Boyuan Zheng on 2023.11.22
case SCF DROP TABLE: {
    return DropTableStmt::create(db, sql_node.drop_table, stmt);
}

case SCF_DESC_TABLE: {
    return DescTableStmt::create(db, sql node.desc table, stmt);
}
...
```

3. 其次,在 "src\observer\sql\executor\"下为 drop_table 添加对应的执行器。对应代码如下:

```
// Created by Boyuan Zheng on 2023.11.22
#pragma once
#include "common/rc.h"
class SQLStageEvent;
* @brief 删除表的执行器
 * @ingroup Executor
class DropTableExecutor
{
public:
  DropTableExecutor() = default;
   virtual ~DropTableExecutor() = default;
   RC execute(SQLStageEvent *sql event);
};
// Created by Boyuan Zheng on 2023.11.22
#include "drop_table_executor.h"
#include "session/session.h"
#include "common/log/log.h"
#include "storage/table/table.h"
#include "sql/stmt/drop table stmt.h"
#include "event/sql_event.h"
#include "event/session event.h"
#include "storage/db/db.h"
RC DropTableExecutor::execute(SQLStageEvent *sql event)
{
   Stmt *stmt = sql_event->stmt();
```

```
Session *session = sql event->session event()->session();

ASSERT(stmt->type() == StmtType::DROP TABLE,
        "drop table executor can not run this command: %d",
static_cast<int>(stmt->type()));

DropTableStmt *drop_table_stmt = static_cast<DropTableStmt *>(stmt);
RC rc =
session->get current db()->drop table(drop table stmt->table name().c str());
return rc;
}
```

4. 类似地,在同目录下的 "command_executor.cpp" 中添加 DROP_TABLE 对应的 case (同时在文件 头添加#include "sql/executor/drop_table_executor.h" ,新增对应头文件):

```
case StmtType::CREATE_TABLE: {
    CreateTableExecutor executor;
    return executor.execute(sql_event);
} break;

// Added by Boyuan Zheng on 2023.11.22
case StmtType::DROP TABLE: {
    DropTableExecutor executor;
    return executor.execute(sql_event);
} break;

case StmtType::DESC_TABLE: {
    DescTableExecutor executor;
    return executor.execute(sql event);
}
...
```

5. 在"src\observer\storage\db\"文件夹下,在"db.cpp"与"db.h"文件中分别加入 database 的 droptable 实现,代码如下:

```
RC Db::drop table(const char *table name)
{
   RC rc = RC::SUCCESS;

   // 检查表是否存在
   Table *table = find table(table name);
   if(table == nullptr) {
      LOG_WARN("Failed to find table %s.", table_name);
      return RC::SCHEMA TABLE NOT EXIST;
   }

   // 删除表
   rc = table->drop(table name);
   if(rc != RC::SUCCESS) {
      LOG ERROR("Failed to drop table %s.", table name);
      return rc;
   }

   // 从打开的表中删除
```

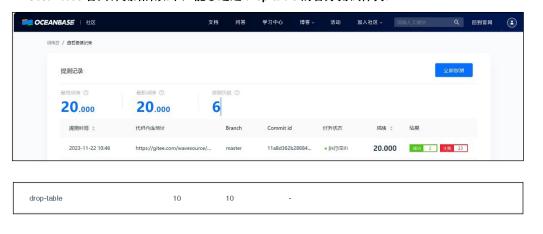

```
opened tables .erase(table name);
LOG_INFO("Drop table success. table name=%s.", table_name);
return rc;
}

// new added
RC drop_table(const char *table_name);
```

6. 在 "src\observer\storage\table\"文件夹下, "table.cpp"与 "table.h"文件中分别加入删除 table 具体操作的实现。代码如下:

```
RC Table::drop(const char *table name)
 RC rc = RC::SUCCESS;
 PersistHandler persistHandler;
 std::string data file = base dir + "/" + table name + ".data";
 std::string table file = base dir + "/" + table name + ".table";
 rc = persistHandler.remove_file(data_file.c_str());
 if(rc != RC::SUCCESS)
   return rc;
 rc = persistHandler.remove_file(table_file.c_str());
 if(rc != RC::SUCCESS)
   return rc;
 for(auto index : indexes ) {
  std::string index file = base dir + "/" + table name + "-" +
index->index meta().name() + ".index";
  rc = persistHandler.remove file(index file.c str());
   if(rc != RC::SUCCESS)
    return rc;
 rc = data buffer pool ->close file();
 if(rc != RC::SUCCESS)
   return rc;
 record handler ->close();
 return rc;
}
  * 删除一个表(新增)
  * @param name 表名
 RC drop(const char *name);
```

7. Oceanbase 官网评测结果如下,能够通过 drop-table 的官方测试样例:

出现的问题:

1. 开始时没有在 miniOB 的 test 分支上进行修改,而是在 main 分支上修改,导致出现了一些不在比赛范围内的问题。

解决方案:

1. 比赛中推荐在 miniOB 的 test 分支上增加代码,因此最终 clone 了 test 分支的代码进行修改。
